- ○ The original goal of your application

  The goal of this application was to simulate a deck of tarot cards focusing only on major arcana cards for private use.

- ○ A paragraph describing **whether or not your app runs**, what you thought of your project, and how well you were able to accomplish what you set out to develop

  The app runs as intended including both upright and reversed cards. Throughout the project there were many ups and downs with the interface and how things would act. I was able to accomplish my goal of creating a deck with multiple uses however I am sad I didn't go further. I could have added additional art to the cards or made the code more efficient. Nevertheless, I was able to finish my project in its entirety and add features not originally intended like multiple spreads and time into the program.

- ○ A **SCREENSHOT** of your program if it can run

```
What would you like to ask the tarot cards What is the future looking like for me
we will do a three card spread
the first card represents your past
The Magician
Represents: Willpower, creation, inner strength, and manifestation
the secound card represents your present
The Devil
Represents: Material focus, material possessions, trapped in bondage, addictions, depression, negative thinking, and betrayal
the third card represents your future
The Reversed Star
Represents: Despair, lack of hope, creative block, boredom, and focusing on the negative
```

- ○ Instructions on how to run your code and what the user should do to go through the flow of the program.

  To run the program simply type a question into the box prompt. The program will shuffle the cards and then print them out one by one with some space in between draws telling the user the name of the card and what it represents. What it means to the user given the spread is entirely up to their interpretation
